

Exadata Fleet Update

Update at scale

Operations Advisor Team

Office of CTO | EMEA Technology Engineering

June 2026

What is Exadata Fleet Update*?

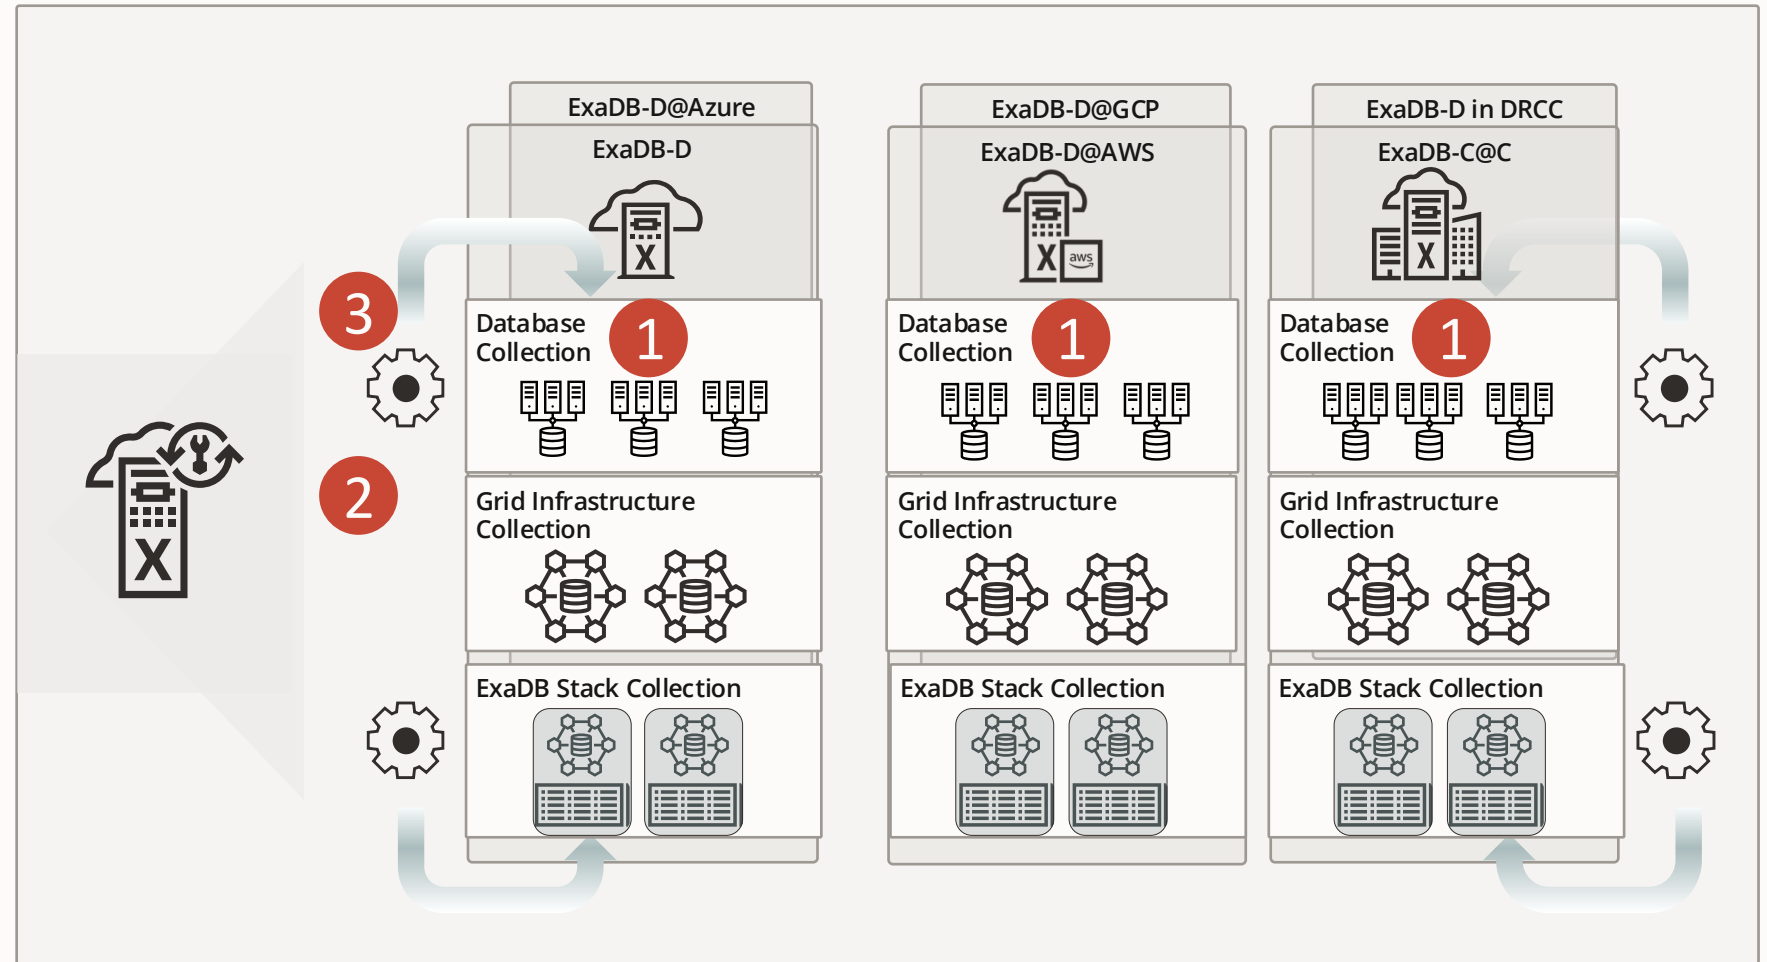

- Automates maintenance operations for large scale database deployments for ExaDB-D, ExaDB-C@C and ExaDB-XS** in OCI but also for ExaDB-D@Azure, ExaDB-D@GCP, ExaDB-D@AWS
- Updates groups of databases, grid infrastructures and VM Guest OS in a single maintenance schedule and cycle
- Native OCI service
- Drastically reduce screen transitions and clicks:
 - > For 100 db targets,
 - Using conventional way needs 800 screen transitions
 - Using Exadata Fleet Update needs 4 screen transitions
- Fleet level visibility of patching status highlighting the failures requiring attention
- Full resume and rollback capability at fleet level
- Advanced rolling options

*** Included with for Exadata Database Service on Dedicated Infrastructure, Exadata Database Service on Cloud@Customer and Exadata Database Service on Exascale**

How does Exadata Fleet Update Work?

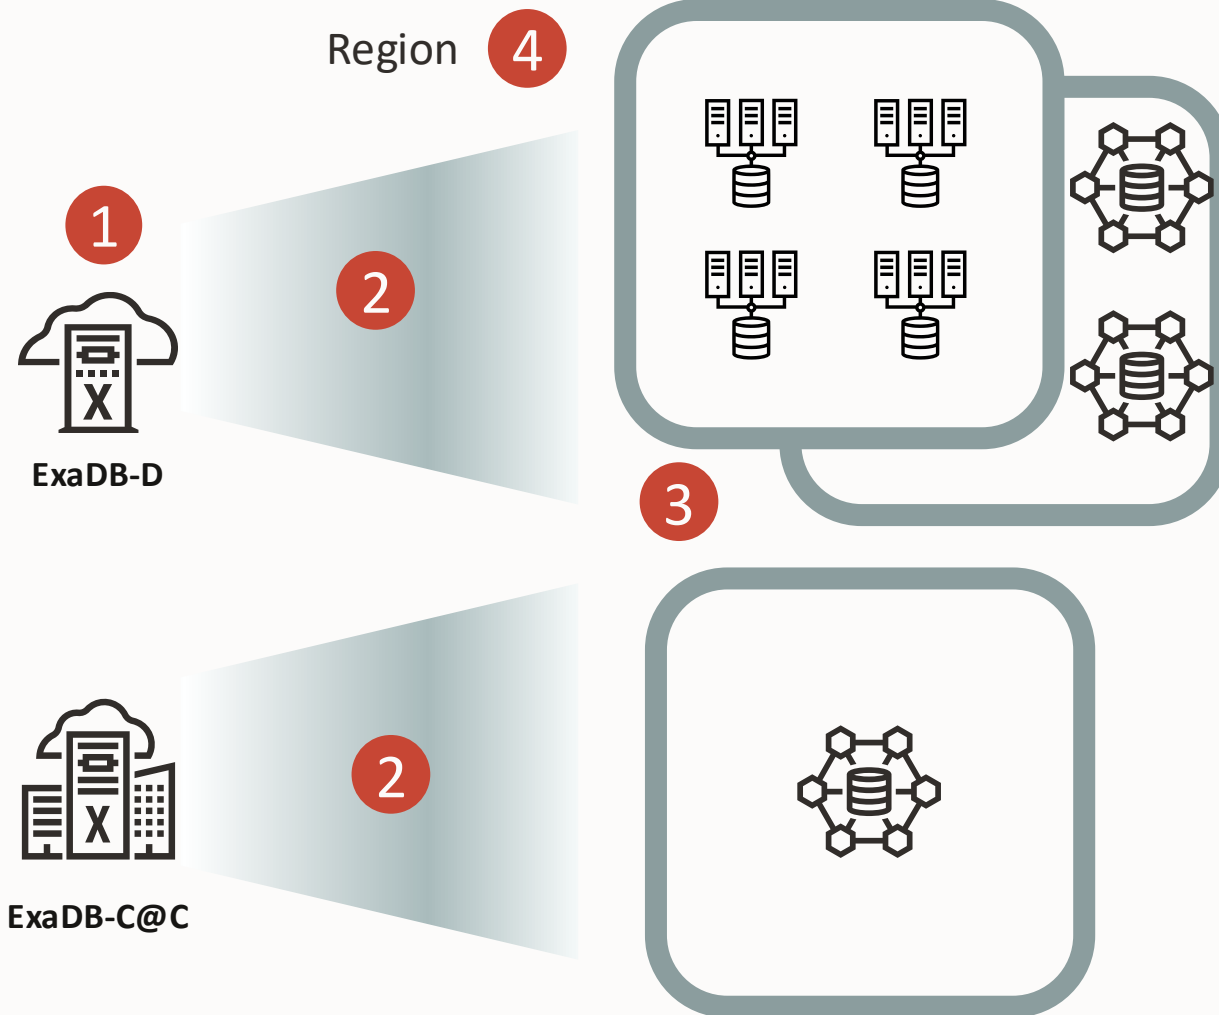

- 1 Create Collection*
(one time action)
- 2 Define Maintenance Cycle
(each patch cycle)
- 3 Execute Maintenance Actions

* Collections are bound to the Exadata Service type, region and target type

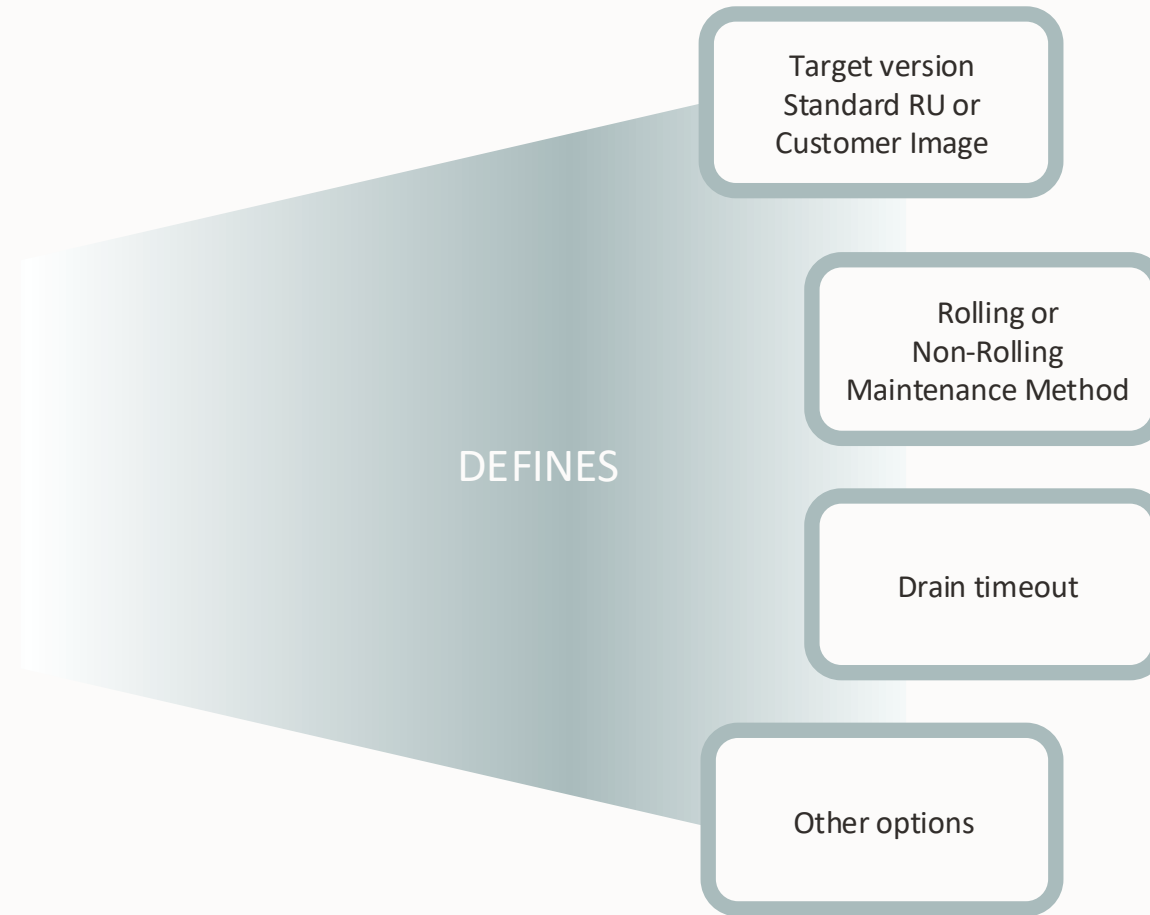

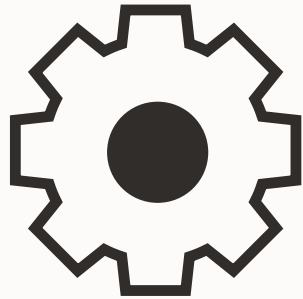

Grouping Targets into Collections

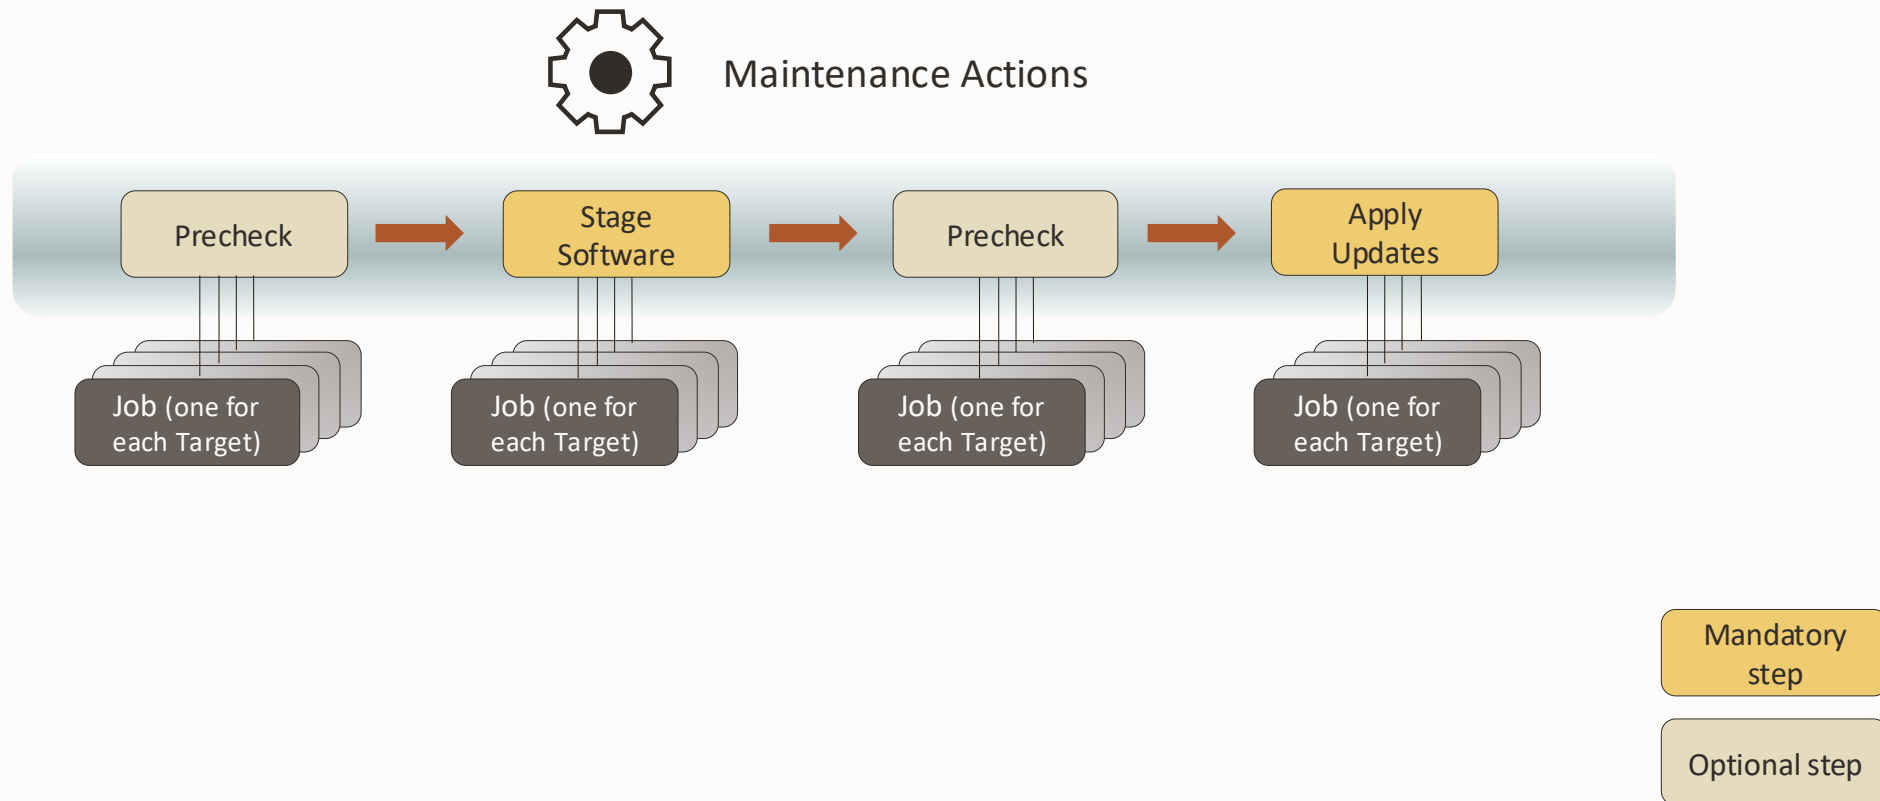

1. Targets are Exadata Database Service : ExaDB-D, ExaDB-C@C or ExaDB-XS
2. Targets can span multiple Infrastructures of the same Oracle Exadata Cloud Service type
3. Targets of the same type can be grouped in collections
 1. Oracle Databases
 2. Oracle Grid Infrastructure (GI)
 3. Guest OS
 4. ExaDB Stack (Guest OS + GI)
4. A collection is defined in a single region but, can span compartments

What Is A Maintenance Cycle?

How Does A Maintenance Cycle Work?

Exadata Fleet Update Interfaces

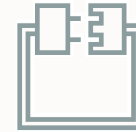

Use your preferred method

OCI Console

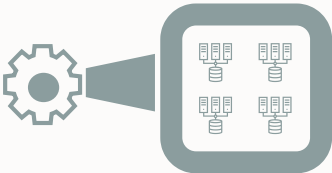

OCI Commandline

OCI Api

Exadata Fleet Update Features

Native Fleet wide patching and upgrades

Maintenance actions for updates are performed on groups instead of individual targets

Advanced (rolling) Patch options

- One node at a time
- 50/50
- Smart batch
- Non-rolling
- Specify drain timeout

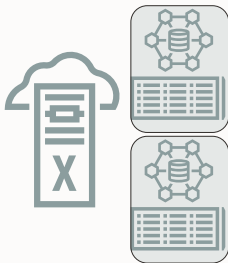

Scheduling

Maintenance actions can be scheduled

Out of-place patching

New homes installed based on Standard Software Images or Custom database software images

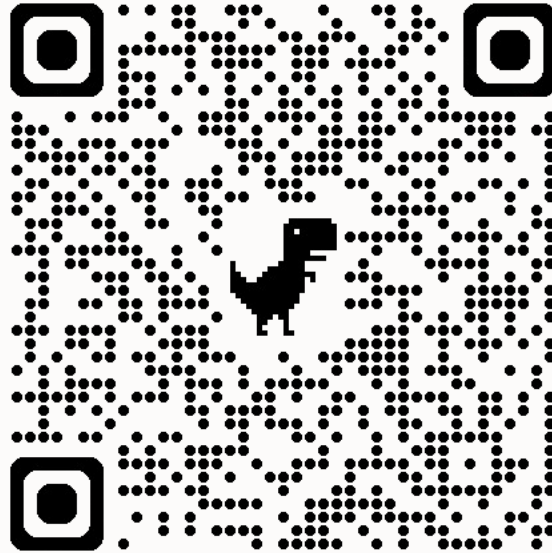

ExaDB Stack

Combine Grid Infrastructure and Guest OS updates in one single flow reducing session draining

Stay tuned
