

ORACLE

OCI Carbon Emission Analysis

Operations Advisory Team

Office of CTO | EMEA Technology Engineering

June 2026

Agenda

- 1. Significance of Carbon Footprint**
- 2. Oracle's commitment**
- 3. How Oracle helps in addressing Carbon emission tracking**

Challenges in sustainability

In 1987, the United Nations first defined sustainable development as “meeting the needs of the present without compromising the ability of future generations to meet their own needs.”

Pillars –Environment , Economy, Society

- How businesses manage production and operation
- Supply chain transparency is necessary to grasp the full extent of a company's environmental, economic, and social impacts
- People expect their employers, vendors, and policymakers to take sustainability seriously and be transparent about it- it prioritizes where they work and shop
- European Union, requires companies to disclose their ESG practices U.S. Securities and Exchange Commission is considering mandating that publicly traded companies, to report to investors how their operations' carbon emissions affect the climate.

Oracle, a committed player for the climate – Carbon Neutrality

- Carbon neutrality (net-zero emissions) for its direct emissions and those of its supply chain by 2050.
- Half down Scope 1, Scope 2, and Scope 3 CO2 emissions by 2030, compared to the 2020 baseline year.
- Oracle aims, in the very short term, to power all of its operations—including its cloud data centers—with 100% renewable energy.
- Oracle is also committed to ensuring that 100% of its key suppliers, both direct and indirect, have implemented an environmental program.

Oracle, a committed player in the climate sector – Performance in 2025

- 100% of Oracle's OCI data centers in Europe are powered by renewable energy.
- 91% of electricity used for all operations, including facilities, real estate, and Oracle's cloud infrastructure, is renewable.
- 100% of major suppliers have implemented an environmental program. 100% of key suppliers have implemented emissions reduction targets, as have 81% of indirect suppliers.
- Across all its sites, Oracle has reduced the volume of waste sent to landfill by 58%.
- Emissions related to employee air travel have been reduced by 68%.

Addressing sustainability through OCI

GHG (greenhouse gas), world's most widely used accounting standards and guidance which outlines three scopes for categorizing the different kinds of emissions a company creates in its own operations and in its wider 'value chain'

Scope 1

Emissions from sources that an organization owns or controls directly

Direct carbon associated with onsite emissions at the cloud regions

Scope 2

Emissions that a company causes indirectly and come from where the energy it purchases and uses is produced

- A. Location based – Emission due to electricity consumption from grid for cloud regions
- B. Market Based – Supplier's emission factor that can be zeroed out by purchasing high quality renewable energy

Scope 3

All emissions not covered in 1 and 2 but created by Organization's value chain

OCI's Scope 1 and 2 emissions contribute to our customers' Scope 3 value chain emission

Support for Scope3 for customers- Approach

Oracle publishes revenue-based and energy based carbon emissions factors across all products and services. The formula for calculating carbon emissions is given below

$$\text{Activity Data} \times \text{Conversion Factor} = \text{Carbon Emission}$$

Customer can calculate Scope 3 emissions using their monthly invoices or the reports available in OCI console.

For the most current emissions factors, see Oracle's Clean Cloud OCI Data Sheet

<https://www.oracle.com/a/ocom/docs/social-impact-datasheet.pdf>

OCI Console and CO2 Emissions Report – Default Reports

Default Reports	
Default reports are pre-built carbon emissions reports defined by OCI	
Name	Calculation method
Location-based Carbon Footprint by Service	Power-based
Market-based Carbon Footprint by Service	Power-based
Carbon Footprint by Service and Description	Spend-based
Carbon Footprint by Service and SKU	Spend-based
Location-based Carbon Footprint by Region	Power-based
Market-based Carbon Footprint by Region	Power-based
Carbon Footprint by Region	Spend-based

Location-Based Report: Gross carbon emissions produced per kWh of energy consumed, based on the energy network of a given region.

Market-Based Report: Remaining carbon emissions after accounting for renewable energy certificates purchased by Oracle to offset emissions in these regions

- Default System Reports on MTCO2e (Metric Tons Carbon dioxide equivalent)
- Charts (Bar, Line, Stacked line) and corresponding data tables of usage can be generated basis selected **time range**, **filters** (Availability Domains, Compartment, Region, Service etc.), and **grouping dimensions** (Availability Domains, Compartment ,Tag, Region etc.

OCI CO2 Emissions Report – Calculation Method

Power-Based Emissions: Tracks the power consumption of the equipment in our Data Center, then allocates that energy to your workloads. The allocated energy is then multiplied by a regional carbon emissions factor, which is based on the composition of the electricity grid in terms of renewable and non-renewable energy.

Note : Currently covers only compute and storage.
Support for database will be available soon.

Spent-Based Emissions: Multiplies the amount spent by a customer for a particular service by a regional carbon emission factor.

Note : Covers all OCI resources types.

OCI Console and CO2 Emissions Report – Reports

Carbon emissions by date (UTC)

Applied filters Chart type Bars Chart granularity Monthly Chart scope Not cumulative

Carbon emissions by date (UTC)

Applied filters Chart type Bars Chart granularity Monthly Chart scope Not cumulative

Location-based Carbon Footprint by Service – Power Based Calculation Method

Market-based Carbon Footprint by Service – Power Based Calculation Method

The customer can consider this data when calculating their Scope 3 emissions

Stay tuned
